

AXIS eReturns

AXIS eReturns provides pro forma online forms, accessible from any location, to accept, process and transmit banking returns and streamline payment processing. This reduces the duplication and time overhead of processing ledger coded entries. Data is stored in a temporary holding area and can be edited before a manual or scheduled release.

Summary of Features

Ledger group configuration

Allows configuration of ledger codes into ledger groups with user level access privileges and configuration settings for the ledger group. The user can select a ledger group and enter transactions against the ledger codes assigned to the ledger group.

Installation

The application is accessible over the intranet via the browser. Hence there is no installation required for the client except a download of the custom component used by the application.

Direct posting

Enables ledger and banking transactions to be posted directly to AXIS Income Management for timely reporting of information and onward posting of individual payments to the host application, typically a general ledger system.

Ad hoc entry

Allows entry of ad hoc ledger items with ledger look-up search or free-format entry.

Transaction listing

Displays standard transaction and payment details on the screen once the form has been submitted, with the option to print details on a Windows printer.

Reporting

Provides a comprehensive set of standard reports for viewing the transactions at various stages, including an audit of any changes made prior to release.

Shared configuration

Uses the same ledger files as AXIS Counter Receipting thereby ensuring continuity of functionality wherever the payment is processed within an organisation.

Online help

Offers easy to use online help.
